

LESS GARBAGE, MORE BEAUTY

Let's think about something... Think about one word, five letters. Think about...Earth. What is Earth? This is very simple. But the real question is: What is Earth for us? Environmental problems of our planet are obvious. We live in era when the respect for nature is gone. It does not hurt the Nature, but she will fight against us. If the Nature does not exist, we will not exist. Because, WE ARE THE NATURE!

Earth... one word with so many definitions. Earth can be many things. She can be savior, or a friend. But we are so blind to see the truth, truth behind those big lies. We all know that we live in the century of speed, technology, but also stress and exhaustless. Because of these factors, people forget to enjoy in things that surround them, they don't know anymore how relaxing can be a short walk in the park and with how much energy they can return to the "fight" of life for another day, and how precious memories they can have from it. Since people spend so little time in the nature, it seems that they forget how to take care about what is around them. Modern society based on personal comfort, forgets more and more things without they cannot live. If, in the past, our ancestors could not live without forests (hunting), without rivers (fish), without land for cultivation, today it is impossible to live without the newest mobile phones, clothes made of natural fabrics, luxurious apartments with most expensive furniture. Well, all these "important things" are made only by destroying the environment (overexploitation of forests, overkilling of animals, and high level of pollution of nature).

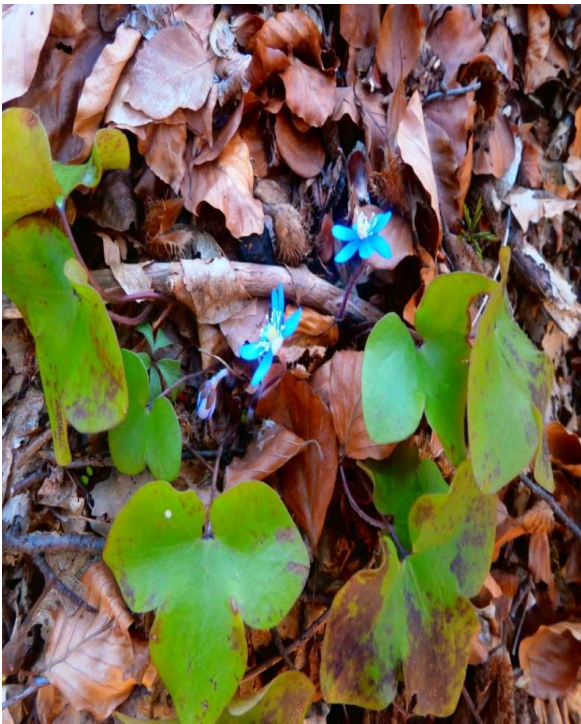

Imagine the Nature as a puzzle. We all know how one puzzle piece can be important, because it is of key importance for creating the whole unit, so until we keep its pieces together, the Nature is complete. Destroying of one part means the natural balance is destroyed. The difference can be seen when we look around ourselves...

Economical and industrial development improved the life of humans, but living standard requires the pollution of tree basic elements of life: water, air and ground.

Waste represents the remains of material that used for the creation of a product and is the result of the production process. All waste is selected in several categories, but the worst category is toxic waste. Toxic waste, in solid, liquid and gaseous state, can cause illnesses, even death for humans, as well as destroy living environment, if it is not transported and discharged correctly.

When we think about Earth, we think about nature, about recycling... People are not aware that they can pollute the nature with a single piece of paper. Waste bin? Yes, but not enough. Recycling? Yes, but not everyone. Change for brighter future? Yes, we have hope.. When we say there are not enough waste bins, it is because people throw garbage everywhere!! It is the sad truth. The world is in truly bad state. We cannot change the past or the present, but we surely can change the future.

How can we do it? It is very simple. Some waste bins in many places would be a really good idea. At least than, people who keep throwing garbage everywhere will not have the excuse to do so. Many people can show us the way to better future. Let's think about it positively, with people who can understand, and with those who don't want to understand. But we can wake them up. We can point to their mistakes with brochures about the influence of waste on the environment. Because the future can be tomorrow, in seven days or in ten years. And remember that we have what many people don't: we have hope...

We are satisfied with walk in the fresh mountain air, but those mountains, in which new houses and hotels are built daily, will not be our lungs, our savior. Their forest with fewer trees will stop to breath for us. Let's remember the saying: "We did not inherit this planet from our fathers, but we lend it from our grandsons". We all know very well what we do with our inheritance, someone spends it, many of us destroy it, and rarely some keep and improve it. The same is valid for this planet. The people act as if the planet is here during their life, and after that it dies with them. No! We landed all of this from our unborn and to them we have to leave it to them.
